Glass

ITEMS

1×
Lava Bucket

1×
Water Bucket

1

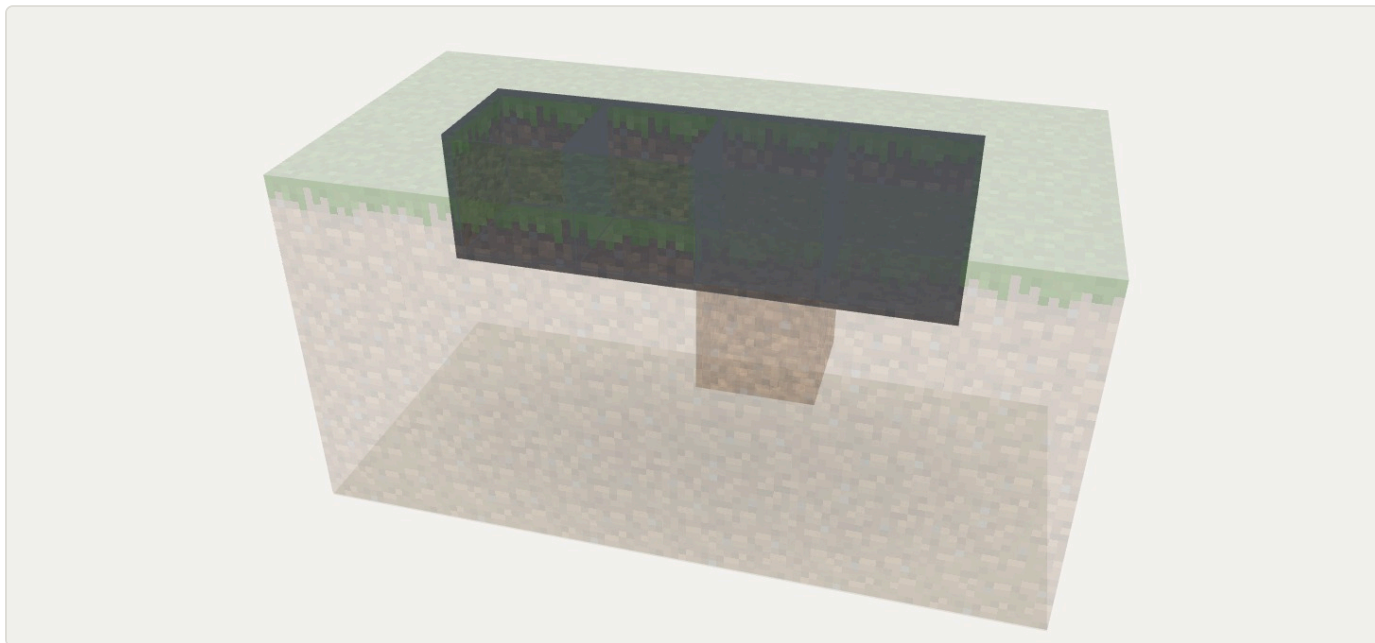

Cells to remove are outlined

4x
Dig out

Dig 4 in a row

1 deep. One end gets the lava, the other end the water.

2

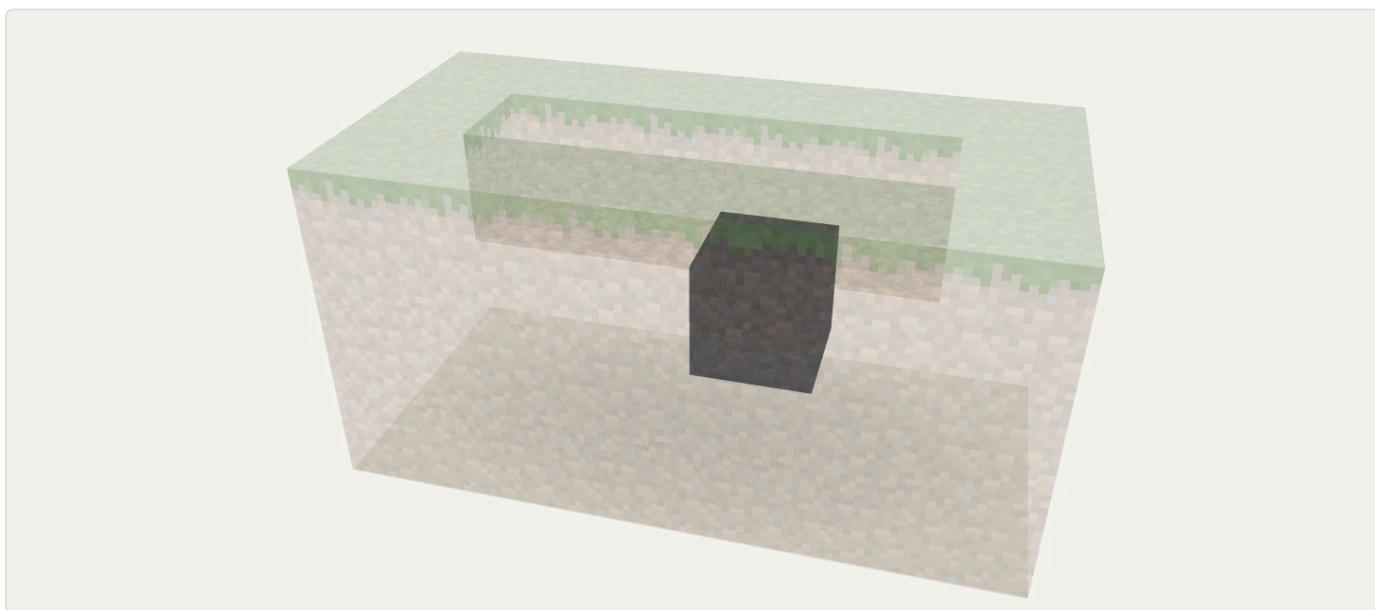

Cells to remove are outlined

1x
Dig out

Dig 1 deeper under the 3rd

Counted from the lava end: the hole sits next to the water end. Without it (or on the lava side) the water reaches the lava source and you get obsidian.

3

□ New blocks are outlined

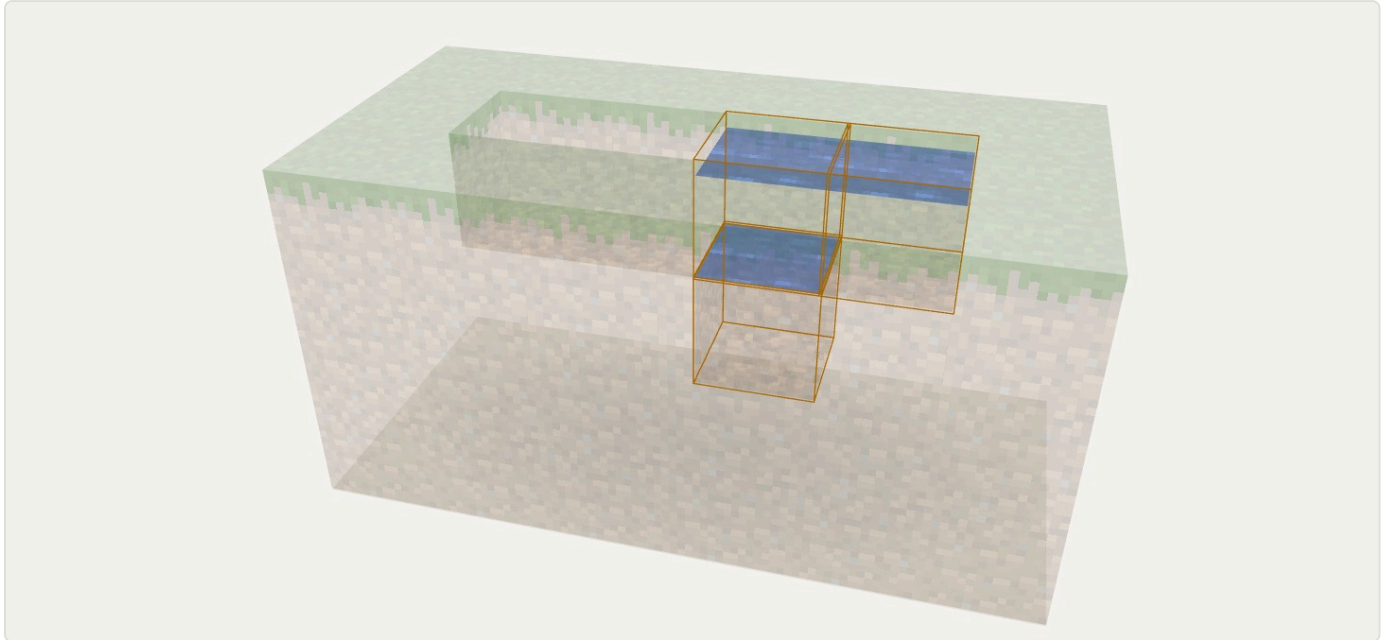

+2 forms by

1×

Water Bucket

Water in the end by the hole

The water flows one block, falls into the hole and stops there.

4

□ New blocks are outlined

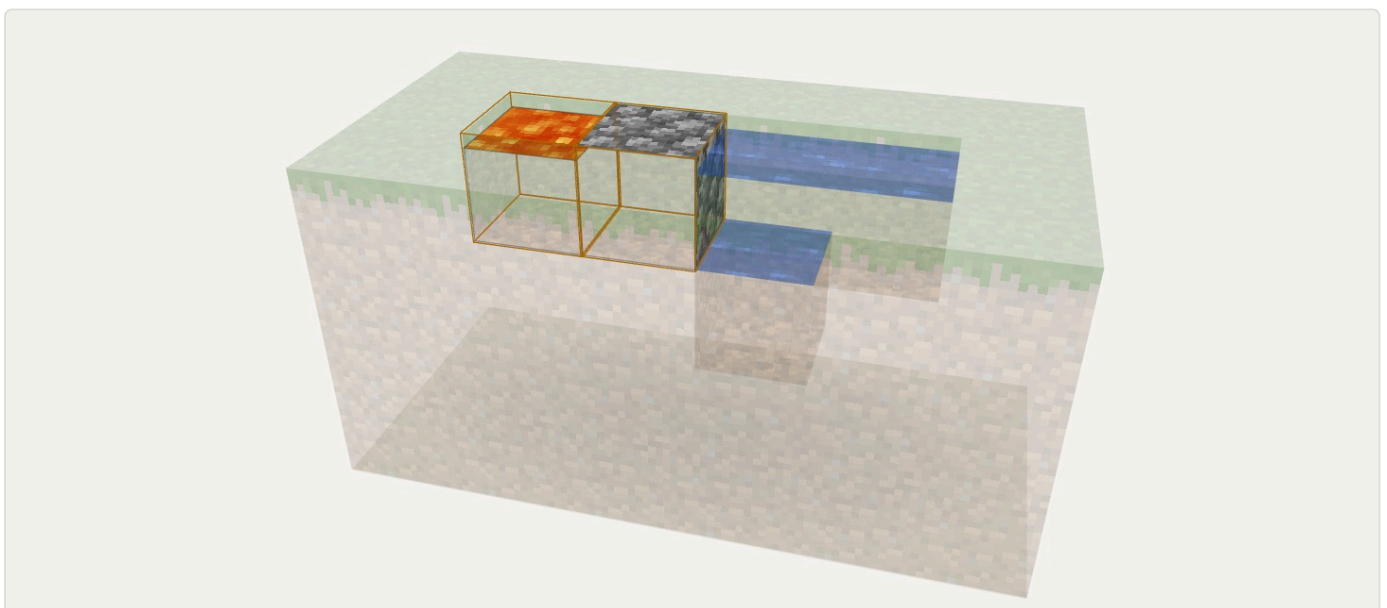

+1 forms by
itself

1×

Lava Bucket

Lava in the other end

It flows into the gap, touches the water and turns into cobblestone (after 1.5 seconds). Keep the lava level with the water: lava falling onto water makes stone.

5

 New blocks are outlined

1×
Glass

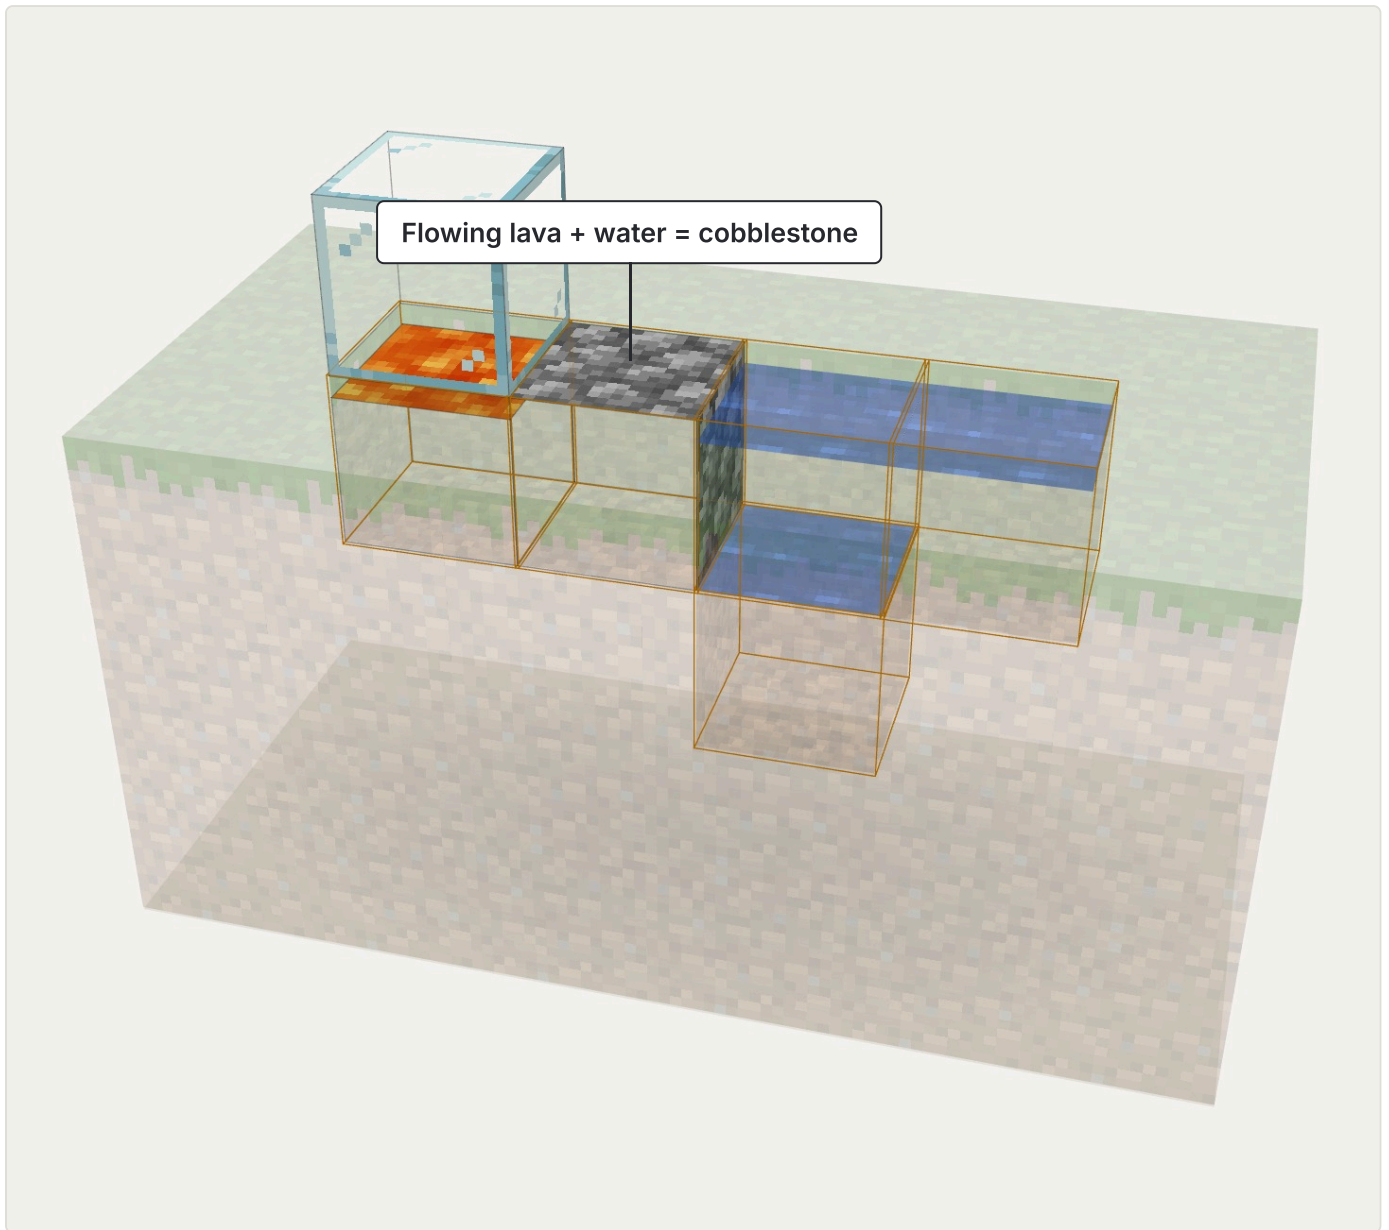

Glass over the lava

Any block that can't burn works. Nobody steps into the lava, and it can't set anything on fire.

Finished!

Why it makes cobblestone

The lava source flows into the gap. Flowing lava that touches water turns into cobblestone; a lava source that touches water turns into obsidian. That is why the water needs the hole: it falls in and never spreads on toward the lava source. Mine the cobblestone and the lava flows in again 1.5 seconds later (lava moves every 30 game ticks in the Overworld, every 10 in the Nether). Tested in Java 26.3: with a stone pickaxe (or better) you mine 40 blocks a minute. A wooden pickaxe needs exactly 1.5 seconds per block, misses the lava's beat and waits a whole round: 20 a minute. Lava that falls down onto water makes stone instead. With soul soil under the gap and blue ice in place of the water you get basalt, even in the Overworld. The glass keeps you out of the lava and stops it from setting anything on fire.
